TGJ234: Custom Project

Background: Communications Technology is a diverse field. There are many topics that fall under the Comm Tech umbrella and creating specific projects for each topic would be cumbersome and potentially limiting to a student's creativity. As such, this project, which can be completed numerous times, aims to allow students to explore topics that are relevant to their interests.

Task Summary: Your task is to create a project that is relevant to your interests related to Communications Technology. Specifically:

1. Pick a topic that you would like to explore. This could include, but is not limited to, animation, graphic design, 3D modeling, game development or web development.
2. Prepare a proposal to discuss with Mr. Varsava. This should include what you hope to accomplish and a timeline for completion.
3. Present your idea to Mr. Varsava **prior to beginning your project**.

Aim for some depth with this project. Ideally, this task should require at least three weeks of concentrated effort to complete. There may be an opportunity to purchase new hardware for the school so dream big with your project idea. Also, as always, have fun. Enjoy the opportunity to chase a whim.

You can pick whatever party you want. Its a free dictatorship.
